- Superior UV stabilizing package.

"Etched graphics are guaranteed not to fade, de-bond or delaminate for the life of the marker."

Bingham & Taylor
Est. 1849

High-V Markers

- Locate assets
- Identify owner
- Alert workers
- Prevent mishaps

Bingham and Taylor High Visibility right-of-way marker system is a versatile, high strength, light weight and maintenance-free way to identify and mark buried pipelines and cables.

Made in the United States and entirely of domestic materials, it complies with US DOT 192.707 and 195.410.

HIGH-V MARKER FEATURES

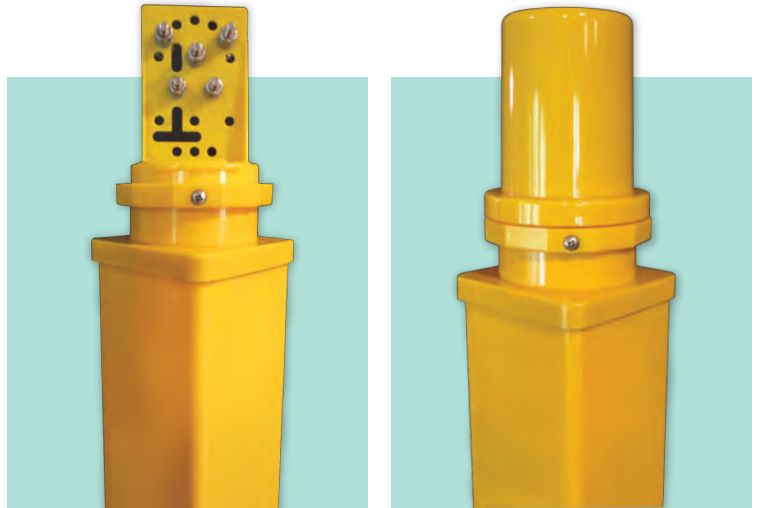

Exceptional Visibility - High-V graphic surfaces can be easily seen from any angle; 4-1/4" wide marking sides are larger and easier to see than similar products.

Variable height and optional contrasting colors insure visibility against any background; markers are easily spotted by aerial patrols.

Versatility – High-V markers can be used with the optional Big Fink®, Little Fink®, or three versions of FinkPlate® as a cathodic protection test station or tracer wire termination box.

Informational – All Bingham and Taylor right-of-way markers can display custom warning signs in multiple languages, and include line identifiers and individual post numbers.

Guaranteed Graphics - Informational graphics are chemically etched directly into the engineered plastic graphic field. Each custom designed warning message is guaranteed not to fade, de-bond or delaminate for the service life of the marker. In lieu of etching, decals are available on request.
